

The Power Bike!

Jacob Lehrer, Jack Armstrong, Josh Castleman

Introduction

- Our goal was to make a bike generate WIFI. Sounds a lot more complicated than you think, but it is still pretty hard.
- Our main question was what is the most efficient way to generate power from a bike.
- Another goal was to spend as little money as possible, using recycled and old parts, like the motor from an old treadmill

Materials and Methods

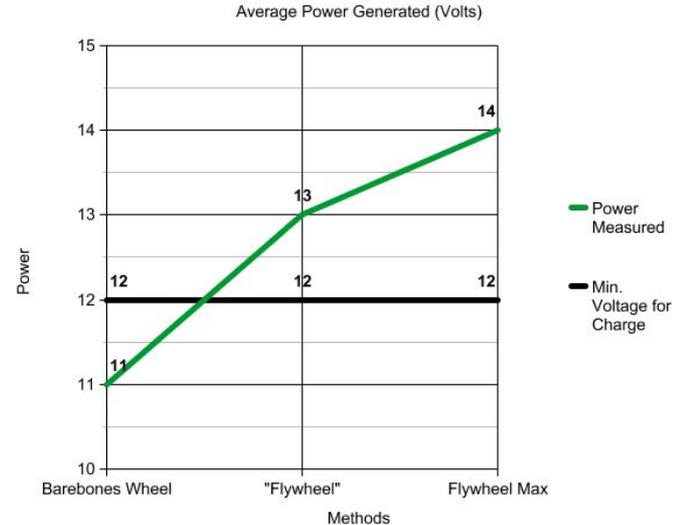

- We made 2 different bike stands, one with outer supports, and one without.

- We used the stand without the supports, because it was lighter and easier to move.
- We used wood 2x4s to make the supports.

Results-Flywheel

- The flywheel, made with solid iron bars, helps the bike wheel move faster and keep momentum at high speeds.
- The flywheel makes it easier to generate higher voltages of electricity to charge the batteries.
- Because of the ease of charging, now anyone who can reach the pedals can generate electricity

Results-Bike Stand

- Two bike stands helps increase the stability of the bike making it easier to continuously pedal
 - This allows for more power to be generated
- **One Bike Stand**
 - Allows for some stability
 - Let's back wheel keep contact with motor
- **Two Bike Stands**
 - Allows for even more stability

Results-Bike Circuit

- Circuit involving a motor turned by the bike, a 12 volt battery, and a power inverter all connected to a device that charges and discharges the battery.
- This system allowed us to save valuable time while charging the battery and power inverter because we didn't have to constantly disconnect and reconnect the battery to the motor.
- When I charged the battery by itself and then connected it to the power inverter, the battery usually dropped below 12 volts within 3 minutes. With our new system, we were able to charge the power inverter while keeping the voltage above 12 volts at the same time.

Conclusions / Next Steps

- I am surprised by the amount of power that the bike can generate, and how cheap it was to build it.
- This bike helped show how hard and complicated generating electricity from a bike really is.
- Some next steps would be to figure out how to make power more efficiently be used, and also to make the bike stand more stable and safe.
